CHAPTER 1 INTRODUCTION

The following is a current report on Edmonton demography, based on the 1986 Civic Census and on some recent revisions relating to Edmonton natural increase and migration.

This report is divided into four chapters which together provide a comprehensive overview of Edmonton demography.

The present chapter will review briefly the report and the context within which it appears. Chapter 2 is a report from the 1986 Civic Census, providing a detailed demographic picture on small areas within the city.

Chapter 3 provides detailed city-wide forecasts of population by 5-year age groups and sex, in the form of two different scenarios. The first scenario is based on a set of assumptions adopted early in 1987, and it is presently the official forecast of Edmonton. Scenario 2 is based on somewhat more updated assumptions. It is considered a working forecast, and as its assumptions are still being reviewed, it has not replaced the official forecast in Scenario 1. Some future estimates of population distribution throughout the city, based on Scenario 1, are provided at the end of this chapter.

Finally, Chapter 4 provides estimates of some auxiliary population distributions in an attempt to address questions in recent public enquiries to the Planning and Building Department.

The Edmonton Civic Census, conducted usually each Spring, provides information on the age, sex, marital status and certain occupational distribution of Edmonton residents, as well as details on the distribution of households and dwelling units throughout the City.

The 1986 Civic Census coincided closely with the Federal Census of the same year. Preliminary counts of population and households based on the 1986 Federal Census were released by Statistics Canada recently. The population of Edmonton as of June 3, 1986 Federal Census date, was 569,180 persons. The number of persons in Edmonton as recorded by the Civic Census effective April 1, 1986, was 571,506. The number of "occupied private dwellings" recorded by the Federal Census in Edmonton was 218,799

whereas the number of "households" recorded by the Civic Census was 224,438.

The discrepancy between the Federal figure of "occupied private dwellings" and the civic figure of "households" is at least partially due to difference in definition. The excess of "households" by approximately 6,000 over "occupied private dwellings" consists of counts in institutions such as jails (Edmonton Institution), auxiliary hospitals for chronically ill (Alberta Hospital, Glenrose Hospital), and student dormitories.

The difference of 2,346 persons between the Federal and the Civic Censuses should be attributed mostly to differences in counting procedures with regard to transients. The Civic Census is somewhat more liberal in including some transients in residential counts.

Additional differences in population and household counts likely stem from the time lag of several months between the two censuses (which likely affected counts of student population), as well as possible errors in enumeration. It should be noted, however, that the discrepancy in population counts between the two censuses is less than one half of a percent.

The following review of Edmonton demography is based almost solely on data from the Civic Census.

Questions or further queries regarding this report should be made to Avi Akkerman at 428-3571.

CHAPTER 2 EDMONTON DEMOGRAPHY

The geographic area of the City of Edmonton (67,920 ha) has been divided to 607 Census Enumeration Areas (CEA) for purposes of enumeration in both the Civic and the Federal Censuses. Table 1 lists all Edmonton Census Enumeration Areas. For purposes of this report, each CEA has been assigned a serial number from 1 to 607. These numbers serve as further reference in the Tables that follow, and are given in parentheses preceding each CEA name on the list in Table 1. Further, each CEA as listed in Table 1 corresponds to a geographic area delineated on the City map enclosed to this report.

Each of the 607 Census Enumeration Areas belongs to one of 135 census tracts. A census tract name has the structure *nN.nn* where N is always a digit; *n* is either a digit or a blank. Census Enumeration Area name is composed of the name of the census tract to which it belongs with a serial number *s* appended at the end of the name. Thus, CEA name structure is: *nN.nn s*. The sequence '.00' in CEA name in Table 1 indicates that there are blanks in the corresponding CEA name on the map. The number *s* is a unique identification of each CEA indicating its sequence within the Census Tract.

The population age distribution and numbers of households for each CEA are given in Table 2. The TOTAL at the bottom of Table 2 indicates the population age distribution and the number of households in the City of Edmonton at mid-year 1986.

The population distribution by occupational category for each CEA is provided in Table 3. There are 12 mutually exclusive categories for the population occupational distribution, enumerated by the Civic Census:

1. Preschooler
2. Kindergarten - Grade 6
3. Grade 7 - Grade 9
4. Grade 10 - Grade 12
5. Post secondary student
6. Homemaker
7. Employed Full Time
8. Employed Part Time
9. Not employed and looking for work
10. Retired
11. Unable to work
12. Other

The bottom of Table 3 contains, again, the appropriate totals for the whole city.

Distribution of dwellings by type is given in Table 4. The Civic Census enumeration distinguishes between four different dwelling unit types:

1. Renter occupied
2. Owner occupied
3. Vacant
4. Under construction

The number of dwelling units in each CEA is listed to the right of Table 4, along with the number of households.

Tables 5 through 8 provide some general historical statistics of Edmonton for comparative purposes.

CHAPTER 3 POPULATION FORECASTS FOR EDMONTON, 1986 - 2006

In the recent past, Edmonton has been subject to some significant fluctuations in components of population growth. Current population forecasts are based on assumptions that reflect the past demographic change and future migration volumes.

Tables 9 through 12 show two different sets of demographic assumptions with their subsequent population forecasts.

The first set of assumptions and forecasts (Tables 9 and 10) is presently taken as the reference to future population growth in Edmonton. The demographic assumptions are based on mortality and fertility rates for Alberta and Edmonton in the early 1980s.

Migration assumptions in Table 9 reflect the age distribution of male and female in- and out-migrants, based on the 1982 and 1983 civic censuses. These assumptions are somewhat speculative for lack of any direct data source. The age distribution of male and female migrants in Table 9 is provided as proportional distribution, rather than as a set of absolute numbers.

All demographic assumptions in Table 9 are taken to hold throughout the forecast period. The assumptions are to be considered, therefore, as an average believed to take place between 1986 and 2002.

Table 11 is a set of working demographic assumptions believed to be reflective of the demographic change taking place in Edmonton in the more recent period. Table 11 is structured in the same way as Table 9.

The impact of the demographic assumptions in Tables 9 and 11 takes full effect with the forecast numbers of migrants each year of the forecast period. The numbers of migrants assumed for each of the forecast years are provided in detail throughout Tables 10 and 12.

The difference in the Scenario 1 and Scenario 2 forecasts presently stems from different assumptions regarding age distribution of male and female in- and out-migrants. Scenario 1 assumptions are based on inferences made regarding the age distribution of migrants from vital statistics data and Civic Census counts of 1981, 1982 and 1983. These inferences were however, found to be somewhat unsatisfactory since ratios were based on

relatively small population numbers and their corresponding vital counts in single-year age groups.

Scenario 2 assumptions are based on provincial estimates of the age-sex distribution of net-migrants and on the 1986 Civic Census counts of in-migrant males and females.

Both scenarios have survival rates that seem to be underestimates. As a result, the number of forecast deaths appears to be too high in both projections.

Further inquiry into vital rate changes for Edmonton is being conducted currently in conjunction with the Local Board of Health, with the Department of Social Services and Community Health and with the Population Research Laboratory. Presently, the Scenario 1 forecast in Table 10 is considered the official City of Edmonton forecast for 1986.

The city-wide forecast in Table 10 has been further disaggregated into future subarea population estimates. These estimates, based on development trends and on demographic tendencies in subarea population growth, are given for 31 traffic districts in Table 13.

CHAPTER 4 AUXILIARY POPULATION DISTRIBUTIONS FOR EDMONTON, 1986

Based on recent enquiries from the public as well as from agencies within and outside the City administration, further demographic characteristics of the Edmonton population are presented here.

Tables 14 and 15 provide the 1986 aggregated counts of population and households for 135 census tracts of the City of Edmonton. The aggregated counts are consistent with the disaggregated figures in Table 2, and their geographic reference is in the map enclosed to this report.

Tables 16 and 17 are life tables generated by the Planning and Building Department based on the 1986 Alberta Bureau of Statistics estimates and on mortality data for Alberta for 1986. Numbers in columns e(x) are, respectively, the expectation of life for males and females at the beginning of each 5-year age interval. The life table variables are explained in fuller details at the bottom of Tables 16 and 17. Mortality data for 1986 for Edmonton will be obtained later in 1987 and the respective life tables for Edmonton will be available upon request from the Planning and Building Department.
